

Ming

Every “done” comes with proof

Automatic acceptance for
features built with AI

IBM Bob 2.0 Hackathon

The work left after “done”

AI says the feature is finished.

The developer still has a second job: checking it.

- 01 Open the app and repeat the steps
- 02 Find the failure and capture it
- 03 Explain the problem to the AI
- 04 Check everything again after the edit

A checklist you approve once per run

Add app

Open your HTML, static ZIP or public GitHub website.

Describe

Say what should work.
Ask AI for a checklist.

Review

Read the actions and outcomes.
Choose Approve and check.

Results

See the observed failure
and its recorded evidence.

Ming

Every done comes with proof.

Ready to check

Change app

STEP 3 OF 3

Does this look right?

Ming will do the actions below and check the expected results. Nothing has been tested yet.

01 Enter "Keep the release notes" in "Task name"

Ming will

Enter "Keep the release notes" in "Task name" Then Click "Add task"

Passes when

Visible text includes "Keep the release notes".

02 Reload the page

Ming will

Reload the page

Passes when

Visible text includes "Keep the release notes".

Only these checks will run. Make sure they cover what matters to you.

Advanced options

By choosing Approve and check, you confirm this checklist and let Ming carry out these actions in the preview.

YOUR APP PREVIEW

Field-notes / field-notes.html

Field Notes

Your next task, in one place.

Task name

Add task

Your app is ready. Describe what should work, then review the checklist.

About this preview

A real failure, then a passing revision

After reload: task lost

The screenshot shows the 'shipboard' app interface. At the top, there's a header with the 'shipboard' logo and 'Personal workspace'. Below this, a motivational quote 'MAKE ROOM FOR WHAT MATTERS' is followed by 'Your next great thing starts here.' and a subtext 'One task at a time. Keep your next step in view.' A form titled 'What's your next step?' with a subtext 'A LITTLE PROGRESS, EVERY DAY' contains a 'Task name' input field with the placeholder 'e.g. Ship the release notes' and a '+ Add task' button. Below the form, a section titled 'UP NEXT' shows '0 tasks'. At the bottom, there's a message 'A clear board. A fresh start. Add one task to get moving.' and a footer with 'Small steps. Real progress.' and 'YOUR PERSONAL BOARD'.

After correction: task remains

The screenshot shows the 'shipboard' app interface after a correction. The header and motivational quote are the same. The 'What's your next step?' form is identical. Below the form, the 'UP NEXT' section now shows '1 task'. The task listed is 'Ming acceptance test' with a subtext 'Ready when you are'. At the bottom, there's a message 'Small steps. Real progress.' and a footer with 'YOUR PERSONAL BOARD'.

9
unchanged steps

One real AI draft.
Two source versions.
Original failure preserved.

Actual DOM captures. The corrected sample was prepared in advance.

Evidence your coding AI can act on

The handoff keeps the context

What the user expected
What actually happened
Which actions led to the failure
Which source and checks produced it

Online workflow

Copy the repair instructions.
Paste them into your coding AI.
Bring back the updated app.

Local MCP workflow

An authorized coding agent reads the evidence, edits the source and reruns the original checks.

IBM Bob built the initial foundation

Browser execution
and evidence

Model drafts
and confirmation

Repair and MCP
foundations

Additional tools supported
completion and refinements.

Reusable checks replace repeated manual work

**Ming repeats the browser actions,
records the failure and keeps
the same standard for the next run.**

Online

HTML, built static ZIPs and public
GitHub website folders.
AI drafts require an explicit request.

Local

Running development apps with
the local runner and MCP connection.
The app handles its own dependencies.

Passing means the approved checks passed. It does not certify every possible behavior.
